No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Description

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                        Published Applications AA:*

The invention relates to a method of producing cytotoxic T lymphocytes (TILS) specific for one or more non-tumour self antigen T cell epitopes. The method involves loading antigen presenting cells (APCS) having class I major histocompatibility complex molecules with the T cell epitopes, and culturing the CD8+ T cells with the APCS to activate precursor CD8+ T cells specific for the T cell epitopes. The invention is useful for treating autoimmune disease including rheumatoid arthritis, psoriasis, insulin dependent diabetes, Crohn's disease, inclimmune thyroiditis, insulin dependent diabetes, Crohn's disease, inclimmantory bowel disease, graft versus host disease and transplant rejection and/or allergic disease such as food allergy, hay fever, allergic rhinitis, allergic asthma and venom allergy. The invention is also useful in cell therapy. The present sequence is mouse immunoglobulin E (IGE). This protein is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Producing cytotoxic T lymphocytes for treating e.g. autoimmune diseases, comprises culturing CD8+ T cells with antigen presenting cells to activate precursor CD8+ T cells specific for T the cell epitopes.

  This invention relates to a novel method for inducing an immune response against autologous immunoglobulin E (IgE) in an animal. The method comprises effecting simultaneous presentation of cytotoxic I lymphocyte (CTL) epitope and/or B-cell epitope derived from IgE, and T helper cell cpitope (TH epitope) which is foreign to the animal, by antigen presenting cells (APCs) of the animal's immune system. The epitopes of the invention may be used as a vaccine against allergic diseases. The method of the invention is useful for inducing an immune response against autologous IgE in an animal, which is useful for downregulating autologous IgE in the animal. This method is useful in the prevention and treatment of allergic diseases such as anaphylaxis, allergic thinitis, asthma and atopic dermatitis. The present sequence represents the mouse IgE heavy chain C1-C2-C3-C4 domains used to create the epitopes of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Inducing immune response against autologous immunoglobulin E in an animal, by effecting simultaneous presentation of cytotoxic T lymphocyte epitope an/or B-cell epitope derived from the immunoglobulin.
                                                                                                                                                                                                                                                                                              IgE; allergy; mouse; antiallergic; immunosuppressive; antianaphylactic; antiasthmatic; dermatological; antiinflammatory; immunoglobulin E; IgE; vaccine; anaphylaxis; allergic rhinitis; asthma; atopic dermatitis; heavy chain C domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gautam A;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Voldborg B,

Chen Z;

The present invention describes a method (M1) for identifying peptides that induce cytotoxic T-lymphocyte (CTL) response against immunoglobulin E (IgE), comprising providing a test peptide (T) suspected of being able to bind to major histocompatibility complex (MHC) class I molecule, and evaluating (T) for ability to elicit in a mammal a CTL response to naturally processed and presented IgE peptides, where a peptide that induces such a response is identified. Also described are compositions: (C1) comprising at least one immunogenic peptide (I) identified by (M1); (C2) comprising at least one isolated polynucleotide encoding (I); and (C3) comprising at least one isolated polynucleotide encoding (I); and (C3) comprising antigen-presenting cells that recognise at least one (I) where C1-3 are able to bind to at least one MHC class I molecule and to elicit in a mammal a CTL response to naturally processed and presented IgE peptides. (I-3 have antialleratic, antiasthmatic, immunosuppressive, vasorropic, dermatological, antianifiammatory and cytostatic activities, and can be used as inducers of a CTL response against IgE, and in n vaccines. (I-3 are useful for modulating an IgE-mediated condition in a mammal. C1-3 are useful for modulating an IgE-mediated condition in a mammal. C1-3 are training attopic Mypersensitivity condition, IgE mediated attopic Appersensitivity condition, IgE-mediated non-atopic constitution and presented condition as allergic constitution as allergic condition as allergic condition as allergic. ö rhinitis, allergic asthma, food allergies, or atopic dermatitis), non-atopic hypersensitivity conditions (such as anaphylaxis, and urticaria hives). The present sequence represents an IgE heavy chain amino acid sequence, which is given in an example from the present invention Gape ö Length 421; 77.1%; Score 108; DB 6; Length 42 90.9%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of producing cytotoxic T lymphocytes (CTLs) specific for one or more non-tumour self antigen T cell epitopes. The method involves loading antigen presenting cells (APCS) having class I major histocompatibility complex molecules with the T cell epitopes, and culturing the CD8+T cells with the APCs to activate precursor CD8+T cells specific for the T cell epitopes. The invention is useful for treating autoimmune disease including rheumatoid arthritis, psoriasis, insulin dependent diabetes, Crohn's disease, inflammatory bowel disease, graft versus host disease and transplant rejection and/or allergic asthma and venom allergy. The invention is also useful in cell therapy. The present sequence is mouse immunoglobulin E (IgB) a alleric protein. This protein is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Producing cytotoxic T lymphocytes for treating e.g. autoimmune diseases, comprises culturing CD8+ T cells with antigen presenting cells to activate precursor CD8+ T cells specific for T the cell epitopes.
                                                                                                                                                                                                                                                                                                                                                                                       Cytotoxic T lymphocyte, CTL, tumour, antigen presenting cell, allergy, lupus, autoimmune disease, rheumatoid arthritis, autoimmune nephritis, psoriasis, APC, multiple sclerosis, autoimmune thyroiditis, hay fever, inflammatory bowel disease, insulin dependent diabetes, cell therapy, crohn's disease, allergic rhintis, graft versus host disease, aethma, transplant rejection, mouse, immunoglobulin E, 1gE.

This invention relates to a novel method for inducing an immune response against autologous immunoglobulin E (IgE) in an animal. The method comprises effecting simultaneous presentation of cytotoxic T lymphocyte (CTL) epitope and/or B-cell epitope derived from IgE, and T helper cell epitope (TH epitope) which is foreign to the animal, by antigen presenting cells (APCS) of the animal's immune system. The epitopes of the invention may be used as a vaccine against allergic diseases. The autologous IgE in an animal, which is useful for downregulating autologous IgE in the animal. This method is useful in the prevention and retainment of allergic diseases such as anaphylaxis, allergic rhinitis, asthma and atopic dermatities. The present sequence represents the mouse IgE heavy chain C2-C3-C4 domain optimised for an E.Coli expression system used to create the epitopes used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Inducing immune response against autologous immunoglobulin {\tt E} in an animal, by effecting simultaneous presentation of cytotoxic T lymphocyte epitope an/or B-cell epitope derived from the immunoglobulin.
                                                 Inducing immune response against autologous immunoglobulin E in an animal, by effecting simultaneous presentation of cytotoxic T lymphocyte epitope an/or B-cell epitope derived from the immunoglobulin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              IgE; allergy; mouse; antiallergic; immunosuppressive; antianaphylactic; antiathmatic; dermatological; antiaflammatory; immunoglobulin E; IgE; vaccine; anaphylaxis; allergic rhinitis; asthma; atopic dermatitis; heavy chain C domani; MIGE;

      This invention relates to a novel method for inducing an immune response against autologus immunoglobulin B (IgB) in an animal. The method comprises effecting simultaneous presentation of cytotoxic T lymphocyte (CTL) epitope and/or B-cell epitope derived from IgE, and T helper cell epitope and/or B-cell epitope derived from IgE, and T helper cell epitope (TH epitope) which is foreign to the animal, by antigen presenting cells (APCS) of the animal's immune system. The epitopes of the invention may be used as a vaccine against allergic diseases. The method of the invention is useful for inducing an immune response against autologous IgE in an animal, which is useful for downregulating autologous IgE in the animal. This method is useful in the prevention and treatment of allergic diseases such as anaphylaxis, allergic rhinitis, asthma and atopic dermattiis. The present sequence represents the mouse IgE heavy chain C2-C3-C4 domain with the MIGIS fragment used to create the epitopes used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Inducing immune response against autologous immunoglobulin E in an animal, by effecting simultaneous presentation of cytotoxic T lymphocyte epitope an/or B-cell epitope derived from the immunoglobulin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a novel method for inducing an immune response against autologous immunoglobulin E (IgE) in an animal. This invention relates to a novel method for inducing an immune response against autologous immunoglobulin E (ISE) in an animal. The method comprises effecting simultaneous presentation of cytotoxic T lymphocyte (CTL) epitope and/or B-cell epitope derived from IGB, and T helper cell epitope (TH epitope) which is foreign to the animal, by antigen cell epitope (TH epitope) which is foreign to the animal, by antigen the invention may be used as a vaccine against allergic diseases. The method of the invention is useful for inducing an immune response against autologous IGE in an animal. Which is useful for downregulating autologous IGE in the animal. This method is useful in the prevention and treatment of allergic diseases such as anaphylaxis, allergic rhinitis, as anathma and atopic dermatitis. The present sequence represents he mouse IGE heavy chain C2-C3-C4 domain optimised for a mammalian expression system used to create the epitopes used in the method of the invention
                                                                                                                                                                                                                                                   Inducing immune response against autologous immunoglobulin E in an animal, by effecting simultaneous presentation of cytotoxic T lymphocyte epitope an/or B-cell epitope derived from the immunoglobulin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    IgE; allergy; mouse; antiallergic; immunosuppressive; antianaphylactic; antiasthmatic; dermatological; antiinflammatory; immunoglobulin E; IgE; vaccine; anaphylaxis; allergic rhinitis; asthma; atopic dermatitis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAU80299;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antiganic peptides (I). (T) have anti-allergic, anti-anaphylactic and antiganic peptides (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of 1g5, and so a target effector site on the epsilon-heavy chain of 1g5, and so a target effector site on the epsilon-heavy chain of 1g5, and so a target effector site on the epsilon of mast calls and basophils and downrequiation of 1g5 synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against 1g5-mediated allergies, e.g. food allergies, asthma, maphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (nonmathylactogenic) antibodies. AAY9994 to AAX80084 represent amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         IgE; allergy; mouse; antiallergic; immunosuppressive; antianaphylactic; antiasthmatic; dermatological; antiinflammatory; immunoglobulin E; IgE; vaccine; anaphylaxis; allergic rhinitis; asthma; atopic dermatitis; heavy chain C domain.
                                                                                                                                                                                                                                                                                                                                                                                   New antigenic peptide from the CH3 domain of immunoglobulin E, fusions for immunization against allergy.

The present invention describes a transgenic, non-human animal with its genome altered to constitutively express a molecule having a constant region which can bind an IgE receptor on mast cells in the animals, the molecule having an immunoglobulin structure and being further capable of specifically binding a predetermined antigen. The transgenic animal is ubstances i.e. with antiallargic activity, to affect any allergic substances i.e. with antiallargic activity, to affect any allergic animal, and applying the substance to be evaluated. The present sequence is the mouse immunoglobulin E (IgE) heavy chain, given in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Immunoglobulin E; IgE; epsilon heavy chain; antigenic; antigen; immunogenic; immunostimulatory; carrier protein; helper T cell epitope; antibody; allergy; allergic disease; immunisation; anti-allergic; anti-achimatic; asthma; anaphylactic; anti-achimatic; asthma; anaphylactic; dermatitis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of producing cytotoxic T lymphocytes (CTLs) specific for one or more non-tumour self antigen T cell epitopes. The method involves loading antigen presenting cells (APCS) having class I major histocompatibility complex molecules with the T cell epitopes. The major histocompatibility complex molecules with the T cell epitopes. The invention is useful for the T cells specific for the T cells with the APCS to activate precursor CD8+T cells specific for the T cell epitopes. The invention is useful for treating autoimmune disease including rheumatoid arthritis, psoriasis, insulin dependent diabetes, crohn's disease, inflammatory bowel disease, graft versus host disease and transplant rejection and/or allergic disease such as food allergy, hay fever, allergic rhinitis, allergic asthma and venom allergy. The invention is also useful in cell therapy. The present sequence is mouse immunoglobulin E (IgB) b allelic protein. This protein is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Producing cytotoxic T lymphocytes for treating e.g. autoimmune diseases, comprises culturing CD8+ T cells with antigen presenting cells to activate precursor CD8+ T cells specific for T the cell epitopes.

The present invention describes immunoglobulin B (IgE)-CH3 domain antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (nonmachine) antibodies. AAY30994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    for

(functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AAY79994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       epitope;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antigenic peptide from the CH3 domain of immunoglobulin E, fusions for immunization against allergy.

The present invention describes immunoglobulin E (IgE)-CH3 domain antigenic paptides (1). (1) have anti-allergic, anti-anaphylactic and antigenic paptides (1). (1) have anti-allergic, anti-anaphylactic and antigenic paptides (1). (1) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (1) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (1) that include a promiseuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (nonanaphylaxies) antibodies. AAYY9994 to AAX80084 represent amino acid anaphylactogenic) antibodies. AAYY9994 to AAX80084 represent amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô

New antigenic peptide from the CH3 domain of immunoglobulin E, fusions for immunization against allergy.

Claim 1; Page 100; 155pp; English.

for The present invention describes immunoglobulin E (IgE)-CH3 domain antigenic peptides (1). (1) have anti-allergic, anti-anaphylactic and anti-gasthmatic properties. (1) induces polyclonal antibodies specific is a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downrequiation of IgE synthesis. Conjugates, or fusion peptides, containing (1) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (1) that include a promiscuous T helper cell epitope

Tomplere genomic sequence of the filamentous nitrogen-fixing

Transpacterium Anabaena sp. strain PCC 7120.";

DNA Res. 81205-213(2001).

Thyrrion: Catalyzes a salvage reaction resulting in the formation

of AMP, that is energically less costly than de novo synthesis.

C. - CATALYTY CATIVITY: AMP + diphosphate = adenine + 5-phospho-

C. - PATRWAY: Purine salvage.

C. - PATRWAY: Purine salvage.

C. - SIDBUNT: Homodimer (By similarity).

C. - SIDBUNT: Belongs to the purine/pyrimidine

Dhosphoribosyltransferase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Rakow T.L., Shen S.S.; "Molecular cloning and characterization of protein kinase C from the

(By
sea urchin Lytechinus pictus.";
Submitted (OCT-1993) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: This is a calcium-activated, phospholipid-dependent,
serine- and threonine-specific enzyme (By similarity).
-!- FUNCTION: PCC is activated by diacylglycerol which in turn
phosphorylates a range of cellular proteins. PCC also serves as
the receptor for phorbol esters, a class of tumor promoters (By

Oxidoreductase; NAD; Metal-Jahding; Iron; Iron-sulfur; 2Fe-2S; 4Fe-4S; Quinone; Ubiquinone; Complete proteome.
                                                                                      sulfur (Fe-S) centers, to quinones in the respiratory chain. The immediate electron acceptor for the enzyme in this species is believed to be ubiquinone. Couples the redox reaction to proton translocation (for every two electrons transferred, four hydrogen ions are translocated across the cytoplasmic membrane), and thus conserves the redox energy in a proton gradient (By similarity).

-!- CATALYTIC ACTIVITY: NDH + quinone = NAD(+) + quinol.
                                                                                                                                                                                                                                                                                                                                                                                                     (By similarity).
--- SUBDART: Composed of 13 different subunits. Subunits nuoCD, E, F, and G constitute the peripheral sector of the complex.
---- SIMILARITY: Belongs to the complex I 75 kDa subunit family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       "Complete genome sequence of Vibrio vulnificus CMCP6.";
Submitted (DEC-2002) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: This protein promotes the GPP-dependent translocation of
the nascent protein chain from the A-site to the P-site of the
Golding B., Puehler A.;
"The complete sequence of the 1,683-kb pSymB megaplasmid from the N2-fixing endosymbiont Sinorhizobium meliloti",
Proc. NaLl. Acad. Sci. U.S.A. 98:9889-9894 (2001).
-!-CATALYTICA ACTIVITY: Acetyl phosphate + sulfite = 2-sulfoacetaldehyde + phosphate
-!-COFACTOR: Binds 1 magnesium ion and 1 thiamine pyrophosphate per subunit (By similarity).
-!-PATHMAX: Anaerobic taurine degradation; second step.
-!-PATHMAX: Anaerobic taurine degradation; second step.
-!-SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-!-SIMILARITY: Belongs to the TPP enzyme family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       -1- SUBCELLULAR LOCATION: Cytoplasmic.
-1- SIMILARITY: Belongs to the GTP-binding elongation factor family.
EF-G/EF-2 subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Transferase; Flavoprotein; Thiamine pyrophosphate; Metal-binding; Magnesium; Complete proteome; Plasmid.

-: FUNCTION: This protein promotes the GTP-dependent translocation of the naccent protein chain from the A-site to the P-site of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ribosome.
SUBCELLULAR LOCATION: Cytoplasmic.
SIMILARITY: Belongs to the GTP-binding elongation factor family.
DOCK A.-K., Glasemacher J., Schmidt R., Schoenheit P.,
BOCK A.-K., Glasemacher J., Schmidt R., Schoenheit P.,
Purification and characterization of two extremely thermostable
arrymes, phosphate acetyltransferase and acetate Kinase, from the
hyperthermophilic eubacterium Thermotoga maritima.",
J. Bacteriol. 181:1861-1867(1999).
-!- FUNCTION: IN ADDITION TO ACETYL-COA (100%), THE ENZYME ACCEPTS
PROPIONYL-COA (60%) AND BUTNYYL-COA (30%). HAS A TEMPERATURE
OPTIMIN AT 90 DEGREES CELGIUS.
-!- CATALYTIC ACTIVITY: Acetyl-COA + phosphate = COA + acetyl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .

Submitted (MAR-1992) to the ENBL/GenBank/DDBJ databases.
-!- FUNCTION: Necessary for the structural stability of L-A double-
stranded RNA-containing particles. Necessary for growth at 37
degrees Celsius as well as for maintenance of the Killer plasmid.
-!- SIMILARITY: TO S.POMBE SPAC4G8.14C.

-!- CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome c + 2 H(2)0.
-!- SUBCELLULAR LOCATION: Mitochondrial inner membrane.
-!- SUBLEARITY: Belongs to the cytochrome c oxidase IV family.
                                                                                                                                                                                                                                                                                                                          MEDLINE=97277139; PubMed=9115172; Wu W. Goodman M., Lomax M.I., Grossman L.I.; Wu W., Goodman M., Lomax M.I., Grossman L.I.; Use vidence for "Molecular evolution of Cytochrome c oxidase subunit IV: evidence for positive selection in simian primates."; J. Mol. Bvol. 44:477-491(1997).

-!- PUNCTION: This protein is one of the nuclear-coded polypeptide chains of cytochrome c oxidase, the terminal oxidase in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              "Nucleotide sequence of a mouse cDNA for subunit IV of cytochrome c oxidase.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          01-FEE-1991 (Rel. 17, Created)

Mol. Microbiol. 47:1495-1512(2003).
I. Mol. Microbiol. 47:1495-1512(2003).
I. C.: CATALYTIC ACTIVITY: ATP + N(2) - formyl-N(1) - (5-phospho-D-ribosyl)glycinamide + L-glutamine + H(2)O = ADP + phosphate + 2-(formamido)-N(1)-(5-phospho-D-ribosyl)acetamidine + L-glutamate.
C. I- PATHWAX: De novo purine biosynthesis; fourth step.
I. SUBGNUT: Heterodimer of two subunits, purQ and purL.
C. I- SUBCINITAR LOCATION: Cytoplasmic (By similarity).
C. I- SIMILARITY: Belongs to the FGAMS family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Archaea; Euryarchaeota; Thermococci; Thermococcales; Thermococcaceae;

hypothetical protein alr7383 [imported] - Nostoc sp. (strain PCC 7120) plasmid pCC7120al C; Species: Nostoc sp. PCC 7120

C; Species: Nostoc sp. PCC 7120

A; Note: Nostoc sp. strain PCC 7120 is a synonym of Anabaena sp. strain PCC 7120

C; Date: 14-Dec-2001 #sequence_revision 14-Dec-2001 #text_change 09-Dec-2002

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     US-09-100-414B-100

Sequence 100, Application US/09100414B

Patent No. 6025468

GENERAL INFORMATION:

APPLICANT: Wang, Chang Yi

TILLE OF INVENTION: NOVEL LHRH PEPTIDE;

TITLE OF INVENTION: IMMUNGENS

NUMBER OF SEQUENCES: 106

CORRESPONDENCE ADDRESS:

ADDRESSEE: Morgan & Finnegan, L.L.P.

STREET: 345 Park Avenue

CITY: NY

STREET: NY

COUNTRY: USA
                                                                                                                            RESULT 5

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence

AAY91228-Y91231 represent CETP-derived peptides and AAY91232-Y91241 are immunogens comprising a CETP peptide and a Th epitope which may be used to prevent or treat arteriosclerosis and cardiovascular disease. AAY91247 and AAY91252-Y91257 are HIV-1 neutralising B-cell epitopes, and AAY91248-Y91251 and AAY91258-Y91273 are antigenic peptides comprising MVH Th and HIV-1 B-cell epitope which may be used as a component in an anti-HIV-1 vaccine. AAY91198 and AAY91199 are respectively an immunostimulatory invasin protein epitope from Yersinia species, and hinge spacer peptide, both of which may optionally be used in the antigenic peptides of the invention. (Updated on 12-SEP-2003 to standardise OS field)

The specification describes peptide immunogens comprising a synthetic releasing hormone teleasing hormone (LHRH). The peptide immunogens cause induction of a specific immune response to LHRH which is involved in regulation of a specific immune response to LHRH which is involved in regulation of spermatogenesis, ovulation, cestrus, sexual development and secretion of sex hormones. Provision of a promiscuous T helper epitope (which is immunogenicity to the B cell epitopes of the target antigen and thus high antibody titres against the target antigen. The peptide immunogens of the invention are used to vaccinate against mammalian LHRH, for use as (reversible) contraceptive; control of hormone-dependent tumours (cancer of prostent or breast, also endometriosis); to prevent boar taint (and appears in the specification
breast cancer; endometriosis; boar taint; meat quality; immunocastration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                New peptide immunogen containing luteinizing hormone-releasing hormone antigen site and helper T cell epitope, for e.g. contraception and treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     100.0%; Scor.

The invention relates to novel promiscuous T helper cell epitopes (Th), and immunogenic peptides comprising the The epitopes of the invention of and immunogenic peptides comprising the The epitopes and peptide immunogens containing them, are used to induce a T helper cell response.

Containing them, are used to induce a T helper cell response, epetidically against Plasmodium falciparum, cholesteryl ester transport protein (ESTP) or HIV epitopes, but more generally against any pethosen; immunogens may be used for prevention and/or treatment of peptide immunogens may be used for prevention and/or treatment of homone inferions (HIV) foot-and-mouth disease or malaxia); for cancer immunotherapy; for inhibition of the action of luteinising hormone (InHM) for contraception, treatment of hormone releasing hormone (InHM) for contraception, treatment of hormone releasing hormone (InHM) for contraception, treatment of hormone arteriographic and peptides subjects) into an immunogen improves capacity to arteriosclerosis. Incorporation of a promiscuous improves capacity to content of antihodise subjects) into an immunogen improves capacity to conduction of antihodise against a target antiqen. The can replace criterior production of antihodise against a target antiqen. The can appropriated Thelper epitope from the measles virus F (MVF) protein and sequences AMY91124. PAY9125 and AMY91245. Pay1246 protein and sequences AMY91144. Pay10ps from the measles virus (HWF) protein and sequences AMY91144. Pay10ps from the measles virus (HWF) surface antigenic peptides comprising an inHMB sequence joined to a promiscuous Th epitope from the MYP antigenic peptides comprising an inHMB sequence joined to a promiscuous Th epitope (AMY91135 are partigenic peptides of promiscuous Th epitope/AMY91137 is the LHMH target antigenic peptides of prevent HWF) infection of a human rige (immunogens may be used to prevent HWF) may a human rige (immunogens and AMY91221. Pay1041. PAY91201 are MYH Th epitope/CACC resement of a human rige (immunogens and p

The present sequence is that of a synthetic immunogenic peptide derived from human IgS. This is an example of peptides that can be used in claimed immunostrimulatory complexes of the invention that are specifically adapted to act as adjuvant and as peptide immunogen stabiliser. The complexes comprise a CpG oligonucleotide and a biologically active peptide immunogen. The complex is particulate and can efficiently present peptide immunogen. The complex is particulate and can oproduce an immune response. The complexes may be prepared with various ratios of peptides to CpG oligonucleotides to provide different physical properties, such as the size of the microparticle. An immunostimulatory complex comprising the present IgE derived peptide can be used in an anti-IgB immunotherapeutic vaccine for the treatment of allergy.
                                                                                                            Immunostimulant; vaccine; human; immunogen; IgE; immunotherapy; allergy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antigenic peptides (1). (1) have anti-allergic, anti-anaphylattic and antigenic peptides (1). (1) have anti-allergic, anti-anaphylattic and antigenic peptides (1) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of 1gB, and so a target effector site on the epsilon-heavy chain of 1gB, and so containing triggering and activation of mast cells and basophils and downregulation of 1gB synthesis. Conjugates, or fusion peptides, containing (1) are used for active immunisation against 1gB-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermartitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (1) that include a promiscuous T helper cell epitope. Conjugates of (1) that include a promiscuous T helper cell epitope conjugates of (1) that include a promiscuous T helper cell epitope conjugates of (1) that include a promiscuous T helper cell epitope conjugates of (1) that include a promiscuous T helper cell epitope conjugates of (1) that include a promiscuous T helper cell epitope conjugates of (1) that include a promiscuous T helper cell epitope conjugates of (1) that include a promiscuous T helper cell epitope. Conjugates of (1) that include a promiscuous T helper cell epitope. Conjugates of (1) that include a promiscuous T helper cell epitope. Conjugates of (1) that include a promiscuous T helper cell epitope. Conjugates of (1) that include a promiscuous T helper cell epitope. Conjugates of (1) that include a promiscuous T helper cell epitope. Conjugates of (1) that include a promiscuous T helper cell epitope. Conjugates of (1) that include a promiscuous T helper cell epitope. Conjugates of (1) that include a promiscuous T helper cell epitope. Conjugates of (1) that include a promiscuous T helper cell epitope. Conjugates of (1) that include a promiscuous T helper cell epitope. Conjugates of (1) that include a promiscuous T helper cell epitope. Conjugates of

                                                                                                                                                                                                         The specification describes peptide immunogens comprising a synthetic helper T cell (Th) epitope and a target antigen, luteinising hormonereleasing hormone (LHR). The peptide immunogens cause induction of a specific immune response to LHRH which is involved in regulation of spermatogenesis, ovulation, cestrus, sexual development and secretion of sex hormones. Provision of a promiscous T helper epitope (which is functional in genetically diverse subjects) provides optimum munogenicity to the B cell epitopes of the target antigen and thus high antibody titres against the target antigen. The peptide immunogens of the invention are used to vaccinate against mammalian LHRH, for use as invention are used to vaccinate against mammalian LHRH, for use as provation to the present tumours (cancer of prostate or breast, also endometriosis); to prevent boar taint (and immunocent meat quality) and for immunocastration. The present sequence

The invention relates to novel promiscuous T helper cell epitopes (Th), and immunogenic peptides comprising the The pitopes of the irvention and immunogenic peptides comprising the The pitopes of the irvention calong with B cell epitopes. The Th epitopes and peptide immunogens containing them are used to induce a T helper cell response.

CC containing them are used to induce a T helper cell response.

Specifically against Plasmodium falciparum, cholesteryl ester transport protein (CETP) or HIV epitopes, but more generally against any pathogen, immunoseative self-antigen or tumour and/or treatment of cancer infections (HIV, foot-and-mouth disease or malaria) for cancer infections (HIV, foot-and-mouth disease or malaria) for cancer infections (HIV, foot-and-mouth disease or malaria) for cancer infections (HIV, foot-and-mouth disease or malaria) for cancer infections (HIV, foot-and-mouth disease or malaria) for cancer infections (HIV, foot-and-mouth disease or malaria) for cancer releasing hormone (LHRB) for contraception, treatment of hormone-releasing the growth of animals; or for treatment of hormone-control of a promiseous infections (HIV) foot-and-mouth disease or immunoseation of a promiseous of a promiseous infection of a promiseous infection of a promiseous of a promiseous infection of animals; or for treatment of hormone-control of animals; or for treatment of hormone-control of animals; or foot-and-mouth helper epitope from the measles virus propersent syntheric The piper epitope from the measles virus (HVP) surface anticenic peptides comprising an IMRH sequence AMY91122-19142, AMY91120 sometocratin and equences AMY91137 is the IMRH target antigenic peptides comprising sometocratin and equence of animals of measure antigenic peptides comprising sometocratin malar entidence of peptides. AMY91201-191107 and AMY91201-191107 are antigenic peptides comprising sometocratic and mouth epitope/LGE cancer antigenic peptides on the MIVE of CCC AMY91201-191107 are mutigenic peptides comprising sometocratic or an und
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          to prevent or treat arteriosclerosis and cardiovascular disease. AAY91247 and AAY91252-Y91257 are HIV-1 neutralising B-cell epitopes, and AAY91248-Y91251 and AAY91258-Y91273 are antigenic peptides comprising WVH Th and HIV-1 B-cell epitope which may be used as a component in an anti-HIV-1 vaccine. AAY91198 and AAY91199 are respectively an immunostimulatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     invasin protein epitope from Yersinia species, and hinge spacer peptide, both of which may optionally be used in the antigenic peptides of the invention. (Updated on 12-SEP-2003 to standardise OS field)
                                                                                                                                                      New artificial T helper cell epitope and derived immunogens with target antigenic site, for immunization against e.g. malaria, arteriosclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The present sequence is that of a synthetic immunogenic peptide derived from human IgE. This is an example of peptides that can be used in claimed immunostimulatory complexes of the invention that are specifically adapted to act as adjuvant and as peptide immunogen stabiliser. The complexes comprise a CpG oligonucleotide and a biologically active peptide immunogen. The complex is particulate and can efficiently present peptide immunogens to the cells of the immune system to produce an immune response. The complexes may be prepared with various ratios of peptides to CpG oligonucleotides to provide different physical properties, such as the size of the microparticle. An immunostimulatory complex comprising the present IgE derived peptide can be used in an anti-IgE immunotherapeutic vaccine for the treatment of allergy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                breast cancer; endometriosis; boar taint; meat quality; immunocastration

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes immunoglobulin E (IgE)-CH3 domain antiganic peptides (I). (I) have anti-allergic, anti-anaphylactic and antiganic peptides (I). (I) have anti-allergic, anti-anaphylactic and attigate attackmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downrequiation of IgE synthesis. Conjugates, or fusion peptides, and alergies, e.g. food allergies, asthma, anaphylaxis or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maphylactogenic) antibodies. AXY9994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Immunostimulant; vaccine; human; immunogen; IgE; immunotherapy; allergy;

Wang CY;

New artificial T helper cell epitope and derived immunogens with target antigenic site, for immunization against e.g. malaria, arteriosclerosis or human immune deficiency virus.

WPI; 2000-160564/14.

Example 6; Page 99; 129pp; English.

The invention relates to novel promiscuous T helper cell epitopes (Th), and minogenic peptides comprising the Th epitopes of the invention along with B cell epitopes. The The pitopes and peptide immunogenic containing them, are used to induce a T helper cell response, containing them, are used to induce a T helper cell response, containing them, are used to induce a T helper cell response, containing them, are used to induce a T helper cell response and correct immunotenestrive self-antibition of the action of lute single hormone induced immunosens may be used for prevention and/or treatment of infections (HIV, foot-an-onuth disease or malaria); for cancer immunotenerapy; for cancer immunotenerapy; for inhibition of the action of lute initial hormone induced in the contraception, treatment of hormone induced in the contraception, treatment of hormone induced in the contraception, treatment of hormone induced in the contraception of particular of a promiscuous Th (Eurotomatic) in a recipient of a minimulation of antibodies and induced capacity in the propertion of a promiscuous Th (Eurotomation of antibodies apalmed a target antigment or production of antibodies apalmed a target antigment or production of antibodies apalmed a target antigment or particular and sequences AV91142-99126 and AA99124 sequence AA99132 and adaptione based on the WRF Th epitope sequence AA99132 and AA99124 are antigment opeptides to produce the measure of longer of captived from these LHRH antigenic peptides comprising an LHRH sequence of longer of a promiscuous Th epitope. AV99116 and AA99120 and AA9 hinge spacer peptide, nic peptides of the both of which may optionally be used in the antigenic pepti Invention. (Updated on 12-SEP-2003 to standardise OS field) protein epitope from Yersinia species, and invasin

The invention relates to novel promiscuous T helper cell epitopes (Th),
and immunogenic peptides comprising the Th epitopes of the invention
containing them, are used to induce a T helper cell response,
containing them, are used to induce a T helper cell response,
containing them, are used to induce a T helper cell response,
containing them, are used to induce a T helper cell response,
containing them, are used to induce a T helper cell response,
containing them are used to induce a T helper cell response,
containing them as a be used for prevention and/or treatment of
immunoteactive self-antiqen or tumour antigen. The Th epitopes and
containing hormone (LHRH) for contraception of luteinising hormone
containing hormone (LHRH) for contraception, treatment of hormone
containing the growth of animals, or for treating allargies or
contracelerosis. Incorporation of a promiscuous Th (functional in
contraction of animals, or for treating allargies or
contained a strong T helper cell-mediated immune response, resulting in
contraction of antibodies against a target antigen. Th can replace carrier
control and pathogen-derived T helper epitope from the measles virus F (MVF)
control and sequences AAV91122-V91144, AXV91225 and AAV91141
crepresent synthetic Th epitopes based on the MVF Th epitopes
contrigen, and sequences AAV91144-V91155 are synthetic epitopes

  à
                                                                                                              antigenic peptides (1). (1) have amit-allergic, anti-anaphylactic and antigenic peptides (1) (1) have amit-allergic, anti-anaphylactic and antigenic peptides (1) induces polyclonal antibodies specific for a target effector site on the opsilon-heavy chain of 195, and so preventing triggering and activation of mast cells and basophils and downrequiation of 195 synthesis. Conjugates, or fusion peptides, containing (1) are used for active immunisation against 195-nediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (1) that include a promiscuous T helper cell epitope (1) target epitope, have increased immunogenicity and may include cyclic target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maphylactogenic) antibodies. AAY9994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Helper T cell epitope; peptide immunogen; LHRH;

The specification describes peptide immunogens comprising a synthetic releasing hormore.

releasing hormore (LHKH). The peptide immunogens cause induction of a specific immune response to LHKH which is involved in regulation of a specific immune response to LHKH which is involved in regulation of speriatogenesis, ovulation, cestrus, sexual development and secretion of speriatogenesis, ovulation, destrus, sexual development and secretion of sex hormones. Provision of a promiscuous T helper epitope (which is functional in genetically diverse subjects) provides optimum immunogenicity to the B cell epitopes of the target antigen and thus high antibody titres against the target antigen. The peptide immunogens of the invention are used to vaccinate against mammalian LHKH, for use as (reversible) contraceptive; control of hormone-dependent tumours (cancer of prostate or breast, also endometriosis); to prevent boar taint (and improve meat quality) and for immunocastration. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Promiscuous T-cell epitope; measles virus F protein; MVF; hepatitis B virus sufface antigon; HBV; immunogenic; B-cell epitope; luteinising hormone releasing hormone; LHRH; contraceptive; anticancer; somatostatin; growth promotion; CD4 receptor; HIV-1; antiviral; FMDV; foct and mouth disease virus; immunoglobulin B: IgE; anti-allergic; Plasmodium falciparum; circumsporozocite; antimalarial; CETP; cholesteryl ester transport protein; anti-arteriosclerotic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New peptide immunogen containing luteinizing hormone-releasing hormone antigen site and helper \mathbb T cell epitope, for e.g. contraception and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to novel promiscuous T helper cell epitopes (Th), and immunogenic peptides comprising the Th epitopes of the invention calong with B cell epitopes. The Th epitopes and peptide immunogens containing them, reused to induce a T helper cell response, calong with B cell epitopes. The Th epitopes and peptide immunogens may be used to induce a T helper cell response, captured in the pitopes but mover the Th epitopes and protein (CTPP) or HIV epitopes, but mover The Th epitopes and immunogens may be used for prevention and/or treatment of infections (HIV, foot-and-mouth disease or malaria); for cancer immunotherapy; for inhibition of the action of luteinising hormone releasing hormone (LHRH) for contraception, treatment of hormone. Compared in the provention of boar taint in meat, and immunocastration); for promoting the growth of animals; or for treating allergies or for promoting the growth of animals; or for treating allergies or articularisational in genetically diverse subjects) into an immunogen improves capacity to induce a strong T helper cell-mediated immune response, resulting in
                                                                                                                        ö
(reversible) contraceptive; control of hormone-dependent tumours (cancer of prostate or breast; also endometriosis); to prevent boar taint (and improve meat quality) and for immunocastration. The present sequence appears in the specification

The specification describes peptide immunogens comprising a synthetic helper T cell (Th) epitope and a target antigen, luteinising hormone-teleasing hormone (LHRH). The peptide immunogens cause induction of a specific immune response to LHRH which is involved in regulation of specific immune response to LHRH which is involved in regulation of sex hormones. Provision of a promiscuous T helper epitope (which is functional in genetically diverse subjects) provides optimum immunogenicity to the B cell epitopes of the target antigen and thus high antibody titres against the target antigen. The peptide immunogens of the invention are used to vaccinate against mammalian LHRH, for use as

WPI; 2003-122561/12. N-PSDB; ACA55181 Novel isolated antigenic peptide comprising amino acid residues of CH3 domain of IgE molecule from first species and a second unrelated species, induces non-anaphylactic anti-IgE immune response in animal.

Claim 3; Page 37-39; 50pp; English.

This invention describes a novel antigenic peptide comprising amino acid residues of an IGE CH3 domain from a first species (ADE1) and amino acid residues of an IGE CH3 domain of a second unrelated species (ADE2), where ADE1 is conserved in the IGE CH3 domain of the second species and ADE2 is not conserved in the IGE CH3 domain of the first species. The novel antigenic peptide induces a non-anaphylactic anti-IGE immune response in

an antique, the invention also discusses the purposed councillation protein comprising the antigenic peptide and an antigenic protein comprising the antigenic peptide of the invention and a heterologue protein carrier, where the fusion protein induces an anti-1gE immune response that does not cause anaphylaxis when administered to an animal. The products of the invention have dermatological, antiinflammatcry and protein induces an animal. The products of the invention protein peptide described is capable of preventing 1gE from binding to high affinity receptors on mast calls and basophils. The products of the invention are useful in the manufacture of a medicament for treating or preventing 1gE-mediated allergies uncluding asthma, allergic rhinitis, gastrointestinal allergies uch as including asthma, allergic rhinitis, an animal, e.g. human or dog. The polynucleotide products are useful for treating 1gE-mediated allergic disorders of isorders, by gene therapy. Antigenic peptides comparising conserved amino acid residues of the CH3 domain of an 1gE molecule from a second unrelated species are capable of inducing a high causing anaphylaxis. ABG/4772-ABG/4785 represents polypeptide sequences used in designing the constructs described in the disclosure of the The invention also discloses the polynucleotide sequence invention

The present invention describes immunoglobulin E (IgE)-CH3 domain antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and anti-genic peptides (I). (I) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (nonanaphylaxic) antibodies. AAY79994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel antigenic peptide comprising amino acid residues of an IgE CH3 domain from a first species (ADE1) and amino acid residues of an IgE CH3 domain of a second unrelated species (ADE2), where ADE1 is conserved in the IgE CH3 domain of the second species and ADE2 is ant conserved in the IgE CH3 domain of the first species. The novel antigenic peptide induces a non-anaphylactic anti-IgE immune response in an animal. The invention also discloses the polymucleotide sequence the antigenic peptide and an antigenic peptide of the invention and a heterologous protein comprising that does not cause anaphylaxis when administered to an animal. The that does not cause anaphylaxis when administered to an animal. The products of the invention have dermatological, antillammatory and ophthalmological activity. The antigenic peptide described is capable of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel isolated antigenic peptide comprising amino acid residues of CH3 domain of IgE molecule from first species and a second unrelated species, induces non-anaphylactic anti-IgE immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CH3 domain, IgE, antigen, non-anaphylactic; anti-IgE; fusion protein, dermatological; antiinflammatory; ophthalmological; allergy; asthma; allergic rhinitis; gastrointestinal allergy; food allergy; eosinophilia; conjunctivitis; glomerular nephritis; flea allergy; atopic dermatitis; gene therapy; human; canine; dog.
chain constant regions 2 and 4 of the opossum IgE and the heavy chain constant region 3 from the dog. It was shown to cause a stronger polyclonal anti-self IgE response than peptides consisting of the same regions from one mammal. Immunogenic peptides, particularly those consisting of different heavy chain constant regions, can be used for vaccination in humans, against bacterial and viral infections and allergies, such as asthm, fur, pollen and food allergies and eczema. (Updated on 12-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                        Gaps

Canine immunoglobulin B peptide fragment and related DNA - useful for the preparation of anti-canine immunoglobulin E antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This is a partial canine immunoglobulin E (IGE) protein. Peptide fragments (AAW24098-106) containing at least five continuous amino acids of this sequence are used for the preparation of anti-canine IGE antibody. The anti-canine IGE antibody can be used for the diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Immunoglobulin B; 1gE; epsilon heavy chain; antigenic; antigen; immunogenic; immunostimulatory; carrier protein; helper T cell epitôpe; antibody; allergy; allergic disease; immunisation; anti-allergic; anti-anaphylactic; anti-asthmatic; asthma; anaphylaxis; dermatitis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel antigenic peptide comprising amino acid residues of an IGE CH3 domain from a first species (ADE1) and amino acid residues of an IGE CH3 domain of a second unrelated species ADE2; where CC ADE1 is conserved in the IGE CH3 domain of the second species and ADE2 is not conserved in the IGE CH3 domain of the first species. The novel antigenic peptide induces a non-anaphylactic anti-IGE immune response in an animal. The invention also discloses the polymucleotide sequence encoding the antigenic peptide and an antigenic fusion protein comprising the antigenic peptide and an antigenic fusion protein comprising carrier, where the fusion protein induces an anti-IGE immune response to the antigenic peptide of the invention and a heterologous protein carrier, where the fusion protein induces an anti-IGE immune response to the invention have dermatological, antiinflammatory and ophthalmological activity. The antigenic peptide described is capable of preventing IGE from binding to high affinity receptors on mast cells and ophthalmological activity. The invention are useful in the manufacture of a medicament for traating or preventing IGE-mediated allergies such as including asthma, allergic rhinitis, gastrointestinal allergies such as including asthma, allergic rhinitis, gastrointestinal allergies such as allergic dermatitis, in an animal, e.g. human or dog. The polyuncleotide products are useful for treating IGE-mediated allergic disorders, by gene therapy. Antigenic peptides comprising conserved amino a second unrelated species are capable of inducing a high content of anti-IGE antibodies when administered to an animal without causing anaphylaxis. ABG74772-ABG7478 sepresents polypeptide sequences conserved in unclaing anaphylaxis. ABG74772-ABG7478 in the disclosure of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel isolated antigenic peptide comprising amino acid residues of CH3 domain of IgE molecule from first species and a second unrelated species, induces non-anaphylactic anti-IgE immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0; Gaps

This invention describes a novel antigenic peptide comprising amino acid residues of an IgE CH3 domain from a first species (ADE1) and amino acid residues of an IgE CH3 domain of a second unrelated species (ADE2), where ADE1 is conserved in the IgE CH3 domain of the second species and ADE2 is antigenic peptide induces a non-anaphylactic anti-ige immune response in animal. The invention also discloses the polymuclecitide sequence an animal. The invention also discloses the polymuclecitide sequence concoding the antigenic peptide and an antigenic peptide of the invention and a heterologous protein comprising the antigenic peptide of the invention and a heterologous protein carrier, where the flusion protein induces an anti-ing immune response that does not cause anaphylaxis when administered to an animal. The products of the invention have dermatological, antiinflammatory and ophthalmological activity. The antigenic peptide described is capable of preventing IgE from binding to high affinity receptors on mast cells and ophthalmological activity. The antigenic peptide described is capable of preventing IgE from binding to high affinity receptors on mast cells and ophthalmological activity. The antigenic peptide allergies confers including athema, allergic rhintis, gastrointestinal allergies confers including athema, allergic rhintis, gastrointestinal allergic seconds allergic conserved amino additional described in an animal, e.g. human or dog. The polymucleotide products are useful for treating IgE-mediated allergic additional and described and animo additional and described and animo additional and described and described and described and described and described and described and described and described and described and described and described and described and described and described and described and described and described and described and described and described and described and described and described and described and described and described and described and described and described and described and d

Novel isolated antigenic peptide comprising amino acid residues of CH3 domain of IgE molecule from first species and a second unrelated species, induces non-anaphylactic anti-IgE immune response in animal.

Claim 2; Page 29-30; 50pp; English.

This invention describes a novel antigenic peptide comprising amino acid residues of an IgB CH3 domain from a first species (ADE1) and amino acid residues of an IgB CH3 domain from a first species (ADE2), where ADE1 is conserved in the IgE CH3 domain of the second species and ADE2 is not conserved in the IgE CH3 domain of the first species. The novel antigenic peptide induces a non-anaphylactic anti-IgE immune response in a manimal. The invention also discloses the polynucleotide sequence encoding the antigenic peptide and an antigenic fusion protein comprising the antigenic peptide of the invention and a heterologous protein concing the antigenic peptide and antigenic peptide of the invention and a heterologua protein carrier, where the fusion protein induces an anti-IgE immune response that does not cause anaphylaxis when administered to an animal. The products of the invention and a heterologua protein cophthalmological activity. The antigenic peptide described is capable of preventing IgE from binding to high affinity receptors on mast cells and opphthalmological activity. The antigenic peptide described is capable of preventing IgE from binding to high affinity receptors on mast cells and basophils. The products of the invention are useful in the manufacture of a medicament for treating or preventing IgE-mediated allergic disorders including asthma, allergic rhinitis, gastrointestinal allergies such as food allergies of the CH3 domain of an IgE molecule from a second unrelated species are capable of inducing a high colling assidues of the CH3 domain of an IgE molecule from a second unrelated species are capable of inducing a high current of antibodies when administered to an animal without causing anaphylaxis. ABG7472-ABG7478 Epresents polypeptide sequences conserved in designing the constructs described in the disclosure of the current of Updated on 23-OCT-2003 to standardise of field of the constructs described in the disclosure of the

Wang CY,

```
The present invention describes immunoglobulin E (IgE)-CH3 domain antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and antigenties reflector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maphylactogenic) antibodies. Apty9994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CH3 domain, IgE, antigen, non-anaphylactic, anti-IgE, fusion protein; dermatological, antinflammatory, ophthalmological, allergy, asthma: allergy castnointestinal allergy; food allergy; eosinophilia; conjunctivitis; glomerular nephritis; flea allergy; atopic dermatitis; onjunctivitis; glomerular nephritis; flea allergy; atopic dermatitis;
                                                                                                                                                                                                                                                                                                                   New antigenic peptide from the CH3 domain of immunoglobulin E, fusions for immunization against allergy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            100.0%; Score 141; DB 3;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes immunoglobulin E (IgE)-CH3 domain antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a Be cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (nonaphylactogenic) antibodies. ANY9994 to AAY80084 represent amino acid, anaphylactogenic) antibodies. ANY9994 to AAY80084 represent amino acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The present invention describes immunoglobulin E (1gE)-CH3 domain antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and anti-anaphylactic and anti-anaphylactic anti-argentist properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and so containing triggering and activation of mast cells and basophils and command (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, aethma, anaphylaxis, or flea-allergy containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, aethma, anaphylaxis, or flea-allergy commission broadction of corresponding peptides or in DRA vaccines. Tecombinant production of corresponding peptides or in DRA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in agentically diverse subjects), in addition to a B cell carget epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AAY19094 to AAY80084 represent amino acid sequences used in the exemplification of the present invention
                                                                                                             Immunoglobulin E, IgE, epsilon heavy chain, antigenic; antigen; immunogranic; immunostimulatory; carrier protein; helper T cell epitope, antibody; allergy; allergic disease; immunisation; anti-allergic; anti-anaphylactic; athma; asthma; anaphylactic; attmatic; asthma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antigenic peptide from the CH3 domain of immunoglobulin E, fusions for immunization against allergy.
                                                        IgE immunogenic peptide conjugate SEQ ID NO:88.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antiganic peptides (I). (I) have anti-allergic, anti-anaphylactic and antiganic peptides (I). (I) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgB, and so preventing triggering and activation of mast cells and bacophils and down-egulation of IgB synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promisecuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (nonanaphylactogenic) antibodies. ARY9994 to AAX80084 represent amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The present invention describes immunoglobulin E (IGE)-CH3 domain antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and a target effector site on the epstlon-heavy chain of IGE, and so preventing triggering and activation of mast cells and basophils and downergulation of IGE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IGE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscious T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (nonanaphylaxica) antibodies. AAY19994 to AAX80084 represent amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               for

The present invention describes immunoglobulin E (IgE)-CH3 domain antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and antigenic properties. (I) induces polyclonal antibodies specific a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated alergies, eg. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. (Conjugates of (I) that include a promiscuous T helper cell apitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (nonaphylactogenic) antibodies, AAV79994 to AAX80084 represent amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

29-DEC-1999.

99WO-US013959. 21-JUN-1999; 98US-00100287. 20-JUN-1998; (UNBI-) UNITED BIOMEDICAL INC.

Wang CY, Walfield AM;

WPI; 2000-160578/14.

New antigenic peptide from the CH3 domain of immunoglobulin E, fusions for immunization against allergy.

Claim 1; Page 99; 155pp; English.

for antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (I) induces polyclonal anti-bodies specific at target effector site on the epsilon-heavy chain of 1gE, and so preventing triggering and activation of mast cells and bacophils and downregulation of 1gE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against 1gE-mediated allergies, eg. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope present invention describes immunoglobulin E (IgE)-CH3 domain
